ABSTRACT:

<CHG DATE=19940730 STATUS=0> The present invention relates to a core body

for plants and flower arrangements. This core body consists according to the

invention of at least one stitched and compression-moulded straw strip (11),

i.e. of biodegradable material, which has been treated with curable binders.

The core body can be manufactured at low cost since the starting material used is essentially straw.

A particularly expedient procedure for manufacturing such a core body consists in compressing the straw strips (11) which have been treated with curable binders in heatable moulds in a temperature range of about 150 to 250 DEG C. <IMAGE>
